1 Probabilistic Bounds

A random variable X has variance $\text{Var}(X) = 9$ and expectation $\mathbb{E}[X] = 2$. Furthermore, the value of X is never greater than 10. Given this information, provide either a proof or a counterexample for the following statements.

(a) $\mathbb{E}[X^2] = 13$.

(b) $\mathbb{P}[X = 2] > 0$.

(c) $\mathbb{P}[X \geq 2] = \mathbb{P}[X \leq 2]$.

(d) $\mathbb{P}[X \leq 1] \leq 8/9$.

(e) $\mathbb{P}[X \geq 6] \leq 9/16$.

2 Inequality Practice

(a) X is a random variable such that $X > -5$ and $\mathbb{E}[X] = -3$. Find an upper bound for the probability of X being greater than or equal to -1.

(b) You roll a die 100 times. Let Y be the sum of the numbers that appear on the die throughout the 100 rolls. Compute $\text{Var}(Y)$. Then use Chebyshev's inequality to bound the probability of the sum Y being greater than 400 or less than 300.

3 Tightness of Inequalities

(a) Show by example that Markov's inequality is tight; that is, show that given $k > 0$, there exists a discrete non-negative random variable X such that $\mathbb{P}(X \geq k) = \mathbb{E}[X]/k$.

(b) Show by example that Chebyshev's inequality is tight; that is, show that given $k \geq 1$, there exists a random variable X such that $\mathbb{P}(|X - \mathbb{E}[X]| \geq k\sigma) = 1/k^2$, where $\sigma^2 = \operatorname{Var} X$.
